

Workshop Toolkit: AI Tools, Links & Prompts

Everything demonstrated in today's session — every tool, every link, every prompt — in one place to take home.

This toolkit is organized into four parts: the emerging AI companies we profiled, the everyday AI tools you can start using this week, the exact prompts used to build a full clinic website live, and a bonus upgrade for anyone building a patient-facing AI smile tool.

Section 1 — The AI Companies We Profiled

Real, currently operating companies across five categories of healthcare AI. All links go directly to the company's official website.

DIAGNOSTIC & IMAGING AI

Qure.ai — AI chest X-ray screening (qXR) for TB and other findings

- qure.ai

Aidoc — AI Operating System (aiOS) prioritizing urgent findings in emergency radiology

- aidoc.com

Viz.ai — AI care-coordination network for stroke and cardiovascular conditions

- viz.ai

PathAI — AI-assisted digital pathology (AISight), FDA-cleared

- pathai.com

CLINICAL DOCUMENTATION (AI SCRIBES)

Abridge — Category-leading ambient AI scribe, deeply integrated with Epic

- abridge.com

Nabla — European AI scribe; never stores patient audio or transcripts

- nabla.com

Ambience Healthcare — Full AI “operating system” for the visit — documentation, coding, nursing

- ambiencehealthcare.com

Suki AI — Voice-first AI assistant for documentation, coding, and workflow

- suki.ai

RESEARCH & EVIDENCE SYNTHESIS

OpenEvidence — Free medical AI search engine for verified US physicians

- openevidence.com

Elicit — AI research assistant for structured literature review and data extraction

- elicit.com

Consensus — Evidence-based Q&A across 200M+ papers with the “Consensus Meter”

- consensus.app

Semantic Scholar — Free AI-powered academic search engine, 200M+ papers indexed

- semanticscholar.org

PATIENT ENGAGEMENT & PRACTICE AUTOMATION

Hippocratic AI — Safety-focused, patient-facing voice agents for outreach and follow-up

- hippocraticai.com

Qventus — Real-time AI for hospital operations — ED flow, scheduling, patient safety

- qventus.com

Keragon — HIPAA-compliant, no-code automation across 300+ healthcare tools

- keragon.com

Assort Health — Agentic AI voice agents for scheduling, triage, and referrals by phone

- assorthhealth.com

DENTAL IMAGING & TREATMENT PLANNING

Overjet — 10 FDA clearances incl. Caries Assist and CBCT Assist

- overjet.com

Pearl — Second Opinion® platform, FDA-cleared, 95%+ accuracy

- hellopearl.com

Videa (formerly VideaHealth) — 35 FDA-cleared indications, embedded natively in Dentrix

- videa.ai

Denti.AI — AI scribing, perio charting, receptionist, and imaging in one suite

- denti.ai

Section 2 — The Everyday AI Toolkit

General-purpose AI tools you can start using this week — no healthcare-specific setup required.

GENERATIVE AI (WRITING, EXPLAINING, DRAFTING)

ChatGPT — OpenAI's general-purpose AI assistant

- chatgpt.com

Claude — Anthropic's AI assistant, strong for careful long-document writing

- claude.ai

Gemini — Google's AI assistant, native Google Workspace integration

- gemini.google.com

RESEARCH AI

Perplexity — Real-time, cited web research assistant

- perplexity.ai

Consensus — Evidence-based research Q&A (see Section 1 for full profile)

- consensus.app

Elicit — Structured literature review assistant (see Section 1 for full profile)

- elicit.com

PRESENTATION AI

Gamma — AI-generated slide decks and documents from a single prompt

- gamma.app

Beautiful.ai — AI-assisted presentation design with smart templates

- beautiful.ai

Canva — Design platform with AI-powered presentation and graphic tools

- canva.com

PRODUCTIVITY AI

Notion AI — AI writing and organization built into Notion workspaces

- notion.com/product/ai

Microsoft Copilot — AI embedded across Word, Excel, and Outlook

- copilot.microsoft.com

DESIGN AI

Canva AI (Magic Studio) — AI-powered design tools inside Canva

- canva.com/magic-studio

Adobe Express — Adobe's AI-assisted quick design tool

- adobe.com/express

VIDEO & VOICE AI

HeyGen — AI avatar-presented video generation — no camera needed

- heygen.com

ElevenLabs — AI voice generation and multilingual dubbing

- elevenlabs.io

Synthesia — AI video generation with digital presenters

- synthesia.io

NO-CODE WEBSITE BUILDERS

Emergent — Full-stack AI website/app builder — frontend, backend, and deployment

- emergent.sh

Lovable — AI website builder focused on fast, polished UI generation

- lovable.dev

Section 3 — Build Your Own Practice Website

The exact two prompts used in today's live demo. Copy them as-is to rebuild the demo, or replace the clinic and doctor details with your own to build a real website.

Prompt 1 — Full Website Generation

Paste this into Emergent or Lovable to generate a complete clinic website in one pass.

Create a premium, modern, responsive website for a dental clinic called “SmileCraft Dental Studio”.

The design should look comparable to leading healthcare websites like Apollo, Mayo Clinic, or Clove Dental, with a clean white and blue color palette, smooth animations, glassmorphism cards, rounded corners, and premium typography.

The website should be fully responsive for desktop, tablet, and mobile.

Homepage Hero Section: large image of a smiling dentist with a patient; headline “Creating Beautiful Smiles with Advanced Digital Dentistry”; subheadline “Personalized, painless, and technology-driven dental care.”; two CTAs — Book Appointment / WhatsApp Us.

Navigation: Home, About, Services, Smile Gallery, Patient Reviews, Blog, Contact.

About: Dr. Sanjana Upadhyay, MDS — Digital Dentistry Expert, Implantologist, Cosmetic Dentist, 10+ years of experience, 5,000+ Happy Patients.

Services: Dental Implants, Smile Designing, Root Canal Treatment, Braces & Aligners, Teeth Whitening, Pediatric Dentistry, Full Mouth Rehabilitation, Preventive Dentistry.

Why Choose Us: AI-Assisted Treatment Planning, Digital Smile Design, Intraoral Scanner, Pain-free Procedures, Same-day Consultation, Personalized Treatment Plans, Experienced Specialists, Transparent Pricing.

Smile Transformation Gallery with a before-and-after slider. Patient Testimonials — at least six cards with photos, 5-star ratings, authentic reviews.

Appointment Booking form: Name, Phone, Email, Preferred Date, Preferred Time,

Treatment Required, Message, Book Appointment button. Floating WhatsApp button.

Emergency Banner with contact number. Google Maps placeholder. Blog section with articles: "How AI is Changing Dentistry", "Dental Implant Guide", "5 Tips for Healthy Teeth", "Smile Designing Explained".

Footer: Address, Phone, Email, Working Hours, Social Media Icons, Copyright.

Extra features: sticky navigation, smooth scrolling, scroll animations, hover effects, animated counters, floating appointment button, dark mode toggle, modern loading animation. Add subtle AI-themed design elements throughout.

Prompt 2 — AI Feature Upgrade

Paste this into the same project, right after Prompt 1, to add AI-powered features.

Upgrade this website into an AI-powered dental clinic.

Add:

- AI Receptionist chatbot that answers patient queries.
- AI appointment booking assistant.
- AI symptom checker (with a disclaimer that it is informational only and not a diagnosis).
- AI treatment cost estimator.
- AI smile assessment upload page where patients can upload a smile photo and receive a placeholder analysis.
- AI-powered FAQ assistant.
- Multilingual support (English, Hindi, Kannada).
- Voice-based appointment booking.
- Patient portal for appointments and reports.
- Doctor dashboard showing today's appointments and patient statistics.
- Responsive design with premium animations and healthcare-themed UI.

Bonus — Fixing the AI Smile Assessment Tool

The smile assessment feature generated by Prompt 2 above is built as a “placeholder analysis” — which means it can return the same generic result regardless of what the patient actually uploads. If your version isn't correctly distinguishing crowded, gapped, discolored, or otherwise different smiles, this is why.

The Fix

Replace the vague instruction “receive a placeholder analysis” with an explicit computer-vision instruction — telling the website builder to actually send the uploaded image to a vision-capable AI model and analyze real, visible features, rather than returning static text.

Upgrade Prompt — Real Computer Vision Smile Analysis

Paste this into your existing project to upgrade the smile assessment feature.

Upgrade the AI Smile Assessment feature to use real computer vision image analysis instead of a generic or placeholder response.

Requirements:

- When a patient uploads a smile photo, send the image to a vision-capable AI model for genuine image analysis — not a static template response.
- Assess and report on these characteristics, only when clearly visible in the photo:
 1. Tooth alignment (straight / mild crowding / moderate crowding / severe crowding)
 2. Spacing (no visible gaps / mild gaps / noticeable gaps between teeth)
 3. Color and shade (bright and even / mild discoloration / noticeable staining)
 4. Symmetry (symmetrical smile / slight asymmetry / noticeable asymmetry)
 5. Gum visibility (normal gum show / higher gum show)
 6. Visible chips, wear, or missing teeth, if clearly present
- The result must be generated dynamically from the actual uploaded image. Two different photos with different smile characteristics must produce two different, clearly distinguishable results — never the same output regardless of input.
- Present findings in a friendly, non-alarming tone and plain language, structured as: “What We Noticed” (3–5 bullet points based on the actual image) followed by “Possible Treatment Directions to Discuss With Dr. [Name]” (e.g. aligners for crowding, whitening for discoloration, veneers for chips).
- Always display a clear disclaimer above and below the results: “This is an

AI-generated visual observation for educational purposes only. It is not a clinical diagnosis. An in-person examination and X-rays are required for an accurate diagnosis and treatment plan.”

- If the uploaded photo is unclear, poorly lit, or does not clearly show the teeth, prompt the patient to re-upload a clearer, well-lit, front-facing smile photo rather than generating a guess.
- Log each uploaded image and its analysis to the doctor dashboard, so Dr. [Name] can review the AI's observations alongside the patient's actual chart before the appointment.

Why This Fix Works

The original prompt asked for “a placeholder analysis,” which most website builders will interpret literally — generating a fixed template that looks real but never actually reads the image. This upgraded version explicitly instructs the builder to route the photo through a real vision model and vary the output based on what it detects, which is what makes two different patients' smiles produce two different results.

Before You Use This With Real Patients

Test it with at least five visibly different smile photos (crowded, gapped, discolored, symmetrical, and a poor-quality photo) to confirm the tool actually differentiates between them before it goes live for real patients.
